Instructions to deploy and run code

R Code Instructions:

1) Download the both dataset from below link
   [train_cab dataset](#)

   [test dataset](#)

2) Create a folder name "Car Fare Prediction" in D drive and extract both dataset in that folder.

3) This is because I set the working directory "D:/Car Fare Prediction/" like this. R script load the data from this location that why please do above steps to run the code.

4) Other instructions and important points are mentioned in R script as #comment

5) All these comments are well explain about the code and reason behind the code.

Python Code Instructions:

1) If you download the both train_cab and test dataset, and extract them in Car Fare Prediction Folder in D drive, then there is no need to do below steps. Only set working directory as "D:\Car Fare Prediction".

2) Download the both dataset from below link
   [train_cab dataset](#)

   [test dataset](#)

3) Create a folder name "Car Fare Prediction" in D drive and extract both dataset in that folder.

4) After that set working directory "D:\Car Fare Prediction" to load the required dataset.
